                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of plasmid pHB4a (ATCC 209645). It includes a neomycin phosphotransferase gene as selectable marker, an Bscherichia coli origin of replication, a TS phage promoter sequence, 2 lac operator sequences, a Shine-Delgarno sequence, the lactose operon repressor gene (lacig) and a multiple cloning set lite linker region. A nucleotide sequence (see AAV66356) coding for novel human cardiac and pancreatic protein (ARP, see AAW80212) can be operatively linked to the promoter and operator (see AAV66373) of pHB4a, and CAPP expressed in E. coli cells following IPTG induction. CAPP polypetides can modulate the differentiation and products can be used in the diagnosis and treatment of pancreatitis and conditions that cause abnormal hypertrophy of the heart, such as hypertension, mycoardial infarction, valve disease and cardiomyopathy. The products can also be used in detection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2579 CGCTGGAGGATCATCCAGCCGGCGTCCCGGAAAACGATTCCGAAGCCCAAACCTTTCATAG

polypeptides in bacterial host cells
                The invention provides TRTK polynucleotides and polypeptides, vectors, host cells and recombinant methods of producing these. Also provided are diagnostic methods for detecting disease states associated with the aberrant expression of TRTK and therapeutic methods for treating such disease states, especially cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360
This sequence is plasmid pHE4-5 which is used in a method to isolate and characterise a human RNA polymerase II elongation factor ELL2 which can be used in the design of treatments for neoplastic disorders (especially leukaemias). Antagonists of the polypeptides or nucleic acids that inhibit the expression of the protein, can be used to inhibit ELL2 susceptibility to neoplastic disorders comprises assaying ELL2 association level in mammalian cells or body fluid and comparing these expression level in mammalian cells or body fluid and comparing these indicates an increased or decrease or decrease in levels indicates an increased or decreased susceptibility. The gene expression level is assayed using the antibody, or by detecting ELL2 mRNA levels. The host cells of may be used to identify compounds which bind to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The present sequence represents pHE405 vector which contains human myelin oligodendrocyte glycoprotein-like protein (MOGp). The presence of MOGp on the surface of oligodendrocytes is associated with oligodendrocyte maturation and with the production of myelin. Products from the present invention can be used for the diagnosis, prognosis and treatment of e.g. cancers, inflammation, or demyelinating disease such as multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CGCTGGAGGATCATCCAGCCGGCGTCCCGGAAACGATTCCGAAGCCCAACCTTTCATAG

lac operators, a Shine-Dalgarno sequence, and the lactose operon repressor gene (lacid). The newly isolated human breast cancer specific gene 1 (BGSP1). The newly isolated human breast cancer the promoter and operator by insertion between the Ndel and Asp718 aftes of the vector, allowing recombinant production of BGSP1 polypeptide (see AAM61213) in host calls. BGSP1 is useful as a breast cancer progressive marker. BGSP1 polymucleotides, bolypeptides and antibodies can be used to develop products for the diagnosis, clinical management and treatment of breast cancer and metastasis.

Sequence 16, Application US/09042105

Sequence 16, Application US/09042105

Patent No. 6040157

GENERAL INFORMATION:

APPLICANT: HU, JING-SHAN

APPLICANT: ROSEN, CRAIG A.

APPLICANT: ROSEN, CRAIG A.

APPLICANT: CAO, LIANG

TITLE OF INVENTION: VASCULAR ENDOTHELIAL GROW
NUMBER OF SEQUENCES: 35

CORRESPONDENCE ADDRESS:

ADDRESSE: STERNE, KESSLER, GOLDSTEIN & FOX STREET: 1100 NEW YORK AVENUE

CITY: WASHINGTON
